

HARVESTERS

Since their introduction, harvesters such as combines, which combine the processes of reaping, threshing, and cleaning grains, have saved humankind a lifetime of hard manual labor. These processes are done more or less automatically today thanks to sophisticated agricultural machinery like the harvester, making each agricultural worker vastly more productive.

Do you want to make your harvester lighter yet stronger? Strenx® performance steel has a high strength-to-weight ratio, so you can use less steel without compromising the strength of your equipment. With Strenx® 700MC and Strenx® 700MC Plus in harvester headers, and other parts, you can make combines and harvesters that weight less, harvest crops more efficiently, and increase productivity. You can also use Hardox® wear plate to fight abrasion in other harvester components.
